Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

Claim 1. (previously presented) A method to determine a physical connectivity configuration of at least a portion of a network when the physical connectivity configuration is unknown, the method comprising:

receiving status information_ without using prior knowledge of port
interconnections, relating to nodes in the portion of the network
whose unknown physical connectivity configuration is to be
determined;
determining, for the nodes, respective labels that indicate one or more
virtual connections traversing the nodes based on the status
information;
identifying at least one link between a subset of the nodes based on the
respective labels; and
determining the physical connectivity configuration of the portion of the
network based on the at least one link.

Claim 2. (original) The method of claim 1, wherein receiving status information comprises: receiving management information base parameters from the nodes.

Claim 3. (original) The method of claim 2, wherein receiving the management information base parameters comprises receiving a virtual path identifier for each of the one or more virtual connections.

Appln. No. 10/062,700

App 1403

Claim 4. (original) The method of claim 2, wherein receiving the management information base parameters comprises receiving virtual channel identifier information for each of the one or more virtual connections.

Claim 5. (original) The method of claim 1, wherein determining respective labels that indicate one or more virtual connections traversing the nodes comprises determining one or more identifiers for each of the one or more virtual connections.

Claim 6. (previously presented) The method of claim 5, wherein identifying at least one link between a subset of the nodes comprises determining the subset of nodes having the same one or more identifiers.

Claim 7. (original) The method of claim 5, wherein determining one or more identifiers comprises determining a virtual path identifier for each of the one or more virtual connections.

Claim 8. (previously presented) The method of claim 5, wherein determining one or more identifiers comprises determining a virtual channel identifier for each of the one or more virtual connections.

Claim 9. (original) The method of claim 1, wherein determining respective labels that indicate one or more virtual connections traversing the nodes comprises:

determining a number of the virtual connections traversing the nodes; and
 determining respective cardinalities of the nodes based on the number of the
 virtual connections.

Claim 10. (original) The method of claim 9, wherein determining at least one link between the subset of the nodes comprises determining the subset of nodes having the same cardinality.

App 1403

Claim 11. (currently amended) A method to determine a physical connectivity configuration of at least a portion of a network when the physical connectivity configuration is unknown, the method comprising:

receiving status information, without using prior knowledge of port interconnections, relating to nodes in the portion of the network whose unknown physical connectivity configuration is to be determined;

determining, for the nodes, respective labels that indicate one or more virtual connections traversing the nodes based on the status information comprising determining a number of the virtual connections traversing the nodes and determining respective cardinalities of the nodes based on the number of the virtual connections;

identifying at least one link between a subset of the nodes based on the respective labels comprising determining the subset of nodes having the same cardinality; and

determining the physical connectivity configuration of the portion of the network based on the at least one link; and

~~The method of claim 10, further comprising~~ receiving additional status information when the subset of nodes exceeds a threshold number of nodes.

Claim 12. (original) The method of claim 11, wherein the threshold number of nodes is 2.

Claim 13. (previously presented) An apparatus to determine a physical connectivity configuration of at least a portion of a network when the physical connectivity configuration is unknown, comprising:

means for receiving, without use of prior knowledge of port interconnections, status information relating to nodes in at least a portion of a network whose unknown physical connectivity configuration is to be determined;

Appln. No. 10/062,700
Amendment Dated January 18, 2007

App 1403

means for determining respective labels for the nodes that indicate one or more
virtual connections traversing the nodes based on the status information;
means for identifying at least one link between a subset of the nodes based on the
respective labels; and
means for determining a physical connectivity configuration of the portion of the
network based on the at least one link.

Claim 14. (previously presented) The apparatus of claim 13, wherein the means for
receiving status information comprises:

means for receiving management information base parameters relating to the
nodes.

Claim 15. (previously presented) The apparatus of claim 14, wherein the means for
receiving the management information base parameters comprises means for receiving a
virtual path identifier for each of the one or more virtual connections.

Claim 16. (original) The apparatus of claim 14, wherein the means for receiving the
management information base parameters comprises means for receiving virtual channel
identifier information for each of the one or more virtual connections.

Claim 17. (original) The apparatus of claim 13, wherein the means for determining
respective labels that indicate one or more virtual connections traversing the nodes
comprises means for determining one or more identifiers for each of the one or more
virtual connections.

Claim 18. (previously presented) The apparatus of claim 17, wherein the means for
identifying at least one link between a subset of the nodes comprises means for
determining the subset of nodes having the same one or more identifiers.

App 1403

Claim 19. (original) The apparatus of claim 17, wherein the means for determining one or more identifiers comprises means for determining a virtual path identifier for each of the one or more virtual connections.

Claim 20. (original) The apparatus of claim 17, wherein the means for determining one or more identifiers comprises means for determining a virtual channel identifier for each of the one or more virtual connections.

Claim 21. (original) The apparatus of claim 13, wherein the means for determining respective labels that indicate one or more virtual connections traversing the nodes comprises:
means for determining a number of the virtual connections traversing the nodes;
and
means for determining respective cardinalities of the nodes based on the number of the virtual connections.

Claim 22. (original) The apparatus of claim 21, wherein the means for determining at least one link between the subset of the nodes comprises means for determining the subset of nodes having the same cardinality.

Claim 23. (currently amended) An apparatus to determine a physical connectivity configuration of at least a portion of a network when the physical connectivity configuration is unknown, comprising:
means for receiving, without use of prior knowledge of port interconnections,
status information relating to nodes in at least a portion of a network
whose unknown physical connectivity configuration is to be determined;
means for determining respective labels for the nodes that indicate one or more
virtual connections traversing the nodes based on the status information
comprising means for determining a number of the virtual connections

Appn. No. 10/062,700

App 1403

traversing the nodes and means for determining respective cardinalities of
the nodes based on the number of the virtual connections;
means for identifying at least one link between a subset of the nodes based on the
respective labels comprising means for determining the subset of nodes
having the same cardinality; and
means for determining a physical connectivity configuration of the portion of the
network based on the at least one link; and
 The apparatus of claim 22, further comprising means for receiving additional
 status information when the subset of nodes exceeds a threshold number
 of nodes.

Claim 24. (original) The apparatus of claim 23, wherein the threshold number of nodes
 is 2.

Claim 25. (previously presented) A method for determining a physical connectivity
 configuration of a node in a network, the method comprising the steps of:
 receiving, without using prior knowledge of port interconnections, status
 information relating to a node in a network and at least one additional
 node in the network;
 determining respective labels that indicate one or more virtual connections
 traversing the node based on the status information;
 identifying at least one link between the node and the at least one additional node
 based on the respective labels; and
 determining a physical connectivity configuration of the node based on the at least
 one link.

Claim 26. (previously presented) An apparatus for determining a physical
 connectivity configuration of a node in a network, comprising:

App'n. No. 10/062,700
Amendment Dated January 18, 2007
Reply to Office Action of September 26, 2006

App 1403

means for receiving, without use of prior knowledge of port interconnections,
status information relating to a node in a network and at least one
additional node in the network;
means for determining respective labels that indicate one or more virtual
connections traversing the node based on the status information;
means for identifying at least one link between the node and the at least one
additional node based on the respective labels; and
means for determining a physical connectivity configuration of the node based on
the at least one link.
